

POWER NETWORKS DIVISION

Alltask with its expert and experienced staff and workforce armed with National Grid Competency Accreditation are able to supply a safe working scaffolding solution within all areas of National Grid and Area Board substations and Transmission lines.

There are other scaffold companies for you to choose from. You know that and we know that. So, we would like to show you seven reasons why we are asking you to give us the privilege of working with you to deliver the best possible safe place of work at height on your Power Networks outage/project.

1. Our dedicated Manager, Scott West - specialises only in the Power Networks sector to ensure our service is totally dedicated to your needs.
2. The reassurance that your access and safe place of work compliance is in safe hands. We've been helping people like yourself for over sixteen years and know the Power Networks business inside out.
3. We have an in-depth, cultural proactive value in terms of health, safety and the environment. Our directly employed safety advisor, Geoff Potter, has the NEBOSH Construction Certificate (as does our Chief Executive) and Scott West has the IOSH Managing Safety Safely accreditation.
4. An 100% commitment and willingness to create long-term alliances and collaboration with main contractors, designers, specifiers and clients as we have already successfully achieved with National Grid at the Isle of Grain.
5. Guaranteed personal attention from Scott West, who will work with you at tender stage for design and operational matters, return your calls and emails promptly and assist in any way to make your outage/project a success.
6. We have an understanding of the unique operational procedures in the Power Networks sector, including interfacing with SAP and managing National Grid and Scottish Power Competent/Person Certificate operatives. We survey each project on an individual basis to identify risks and hazards and develop a safe working methodology.
7. Our scaffold structures are installed in modular system scaffolding; saving you time and making the installation process safer. We utilise aluminium components where possible to reduce operative fatigue and aid programme performance.
